Culture Media Information

Prepared Media: Thermo Scientific™ Remel™ products include more than 1,700 media formulations and formats. Remel Prepared Media are used for the isolation and/or differentiation of microorganisms from samples or specimens. Most are ready for immediate use, with no further preparation necessary. We also manufacture media on a contract basis and on a proprietary basis for our customers. Products designated as “Not Intended For IVD Use” have not been cleared by the FDA for In Vitro Diagnostic Use.

Dehydrated Media: Dehydrated Culture Media are used in our plated and tubed media formulations to ensure that you receive the best media possible. Each raw material component is pre-tested before being used to manufacture the finished product. Each medium is tested against a battery of organisms to assure that the medium performs as it should. Each lot of dehydrated culture medium is tested against the previous lot number to assure uniformity and consistency from lot to lot.

Animal Blood: We maintain a sheep farm to ensure the highest standards possible for the quality of animal blood used in Remel products.

Components: All animal components used in the manufacture of Remel products are of United States origin, or are imported in compliance with USDA/APHA regulations. Imported components are certified by the suppliers to be from countries that are BSE-free.

Quality Assurance: We adhere to the latest FDA Quality Systems Regulations (QSR). In many instances, we have exceeded those guidelines and established more stringent procedures to ensure the integrity of our products.

The Clinical and Laboratory Standards Institute (CLSI) has developed a standard specifying the requirements for quality assurance testing of culture media for the clinical laboratory, “Quality Control for Commercially Prepared Microbiological Culture Media,” M22-A.¹

All lot numbers of Remel products have been tested using quality control organisms which are listed on each IFU (Information For Use) sheet and/or Certificate of Quality for that specific product and have been found to meet or exceed guidelines. The quality control organisms used are derived from ATCC® strains specified in the current CLSI

Approved Standard¹ and/or standard reference method. Additional quality control organisms are often used to validate the performance of a specific medium.

Recording lot numbers and expiration dates of media received, or the retention of Remel's packing slip included with each delivery, meets the CLSI guidelines for lot specific quality control and is recommended for inclusion in your laboratory's quality control program. Certificates of Quality are available upon request. We should be notified of any deficiency so that appropriate action can be taken.

Providing the best quality control program possible is our priority. Quality control procedures are continually updated to reflect the current CLSI guidelines or standard reference methods. When you receive Remel media, you can be assured that the product will give you proper performance when stored and used as directed.

Technical Manual: We have developed a Technical Manual to ensure the user that quality control conforms with or exceeds CLSI standards. The Remel Products Technical Manual contains technical information for all prepared media, including those found on Table 3 in CLSI guideline M22-A¹.

Storage: Prepared media should be stored according to the package label until ready to use. Refrigerated media should be allowed to equilibrate to room temperature before use. Media containing dyes and blood should be protected from the light. Prepared media should not be used past its expiration date or if any visible damage or deterioration has occurred.

Distribution: We maintain a network of distribution facilities to provide you with dependable, rapid, convenient delivery.

Packaging: Plated Media are supplied in packages of ten, fifteen, twenty, forty, and one hundred. Please refer to the catalog to determine specific packaging for each product. We use several types of plastic dishes for Prepared Plated Media. The first two digits of the REF number indicate the container or media Type. See chart below:

Monoplate: The 15 x 60mm, 12 x 85mm, 10 x 100 mm, 15 x 100 mm, or 15 x 150 mm plates contain one type of medium in the plate. Plates, except 15 x 60 mm, have stacking rings which interlock to minimize sliding of plates.

Prepared Culture Media

Biplate: 12 x 85 mm plate divided into two sections containing one medium on both sides or two media, one on each side.

Triplate: 12 x 85mm plate divided into three sections containing one medium in all three sections or different media in each section.

Quadplate: 12 x 85mm plate divided into four sections containing one medium in all four sections or different media in each section.

Individually Wrapped Plate: Plated media in monoplates, biplates, triplates or quadplates packaged in a sealed individual Tyvek® bag. Provides an extended expiration date.

150mm Plate: Plated media used primarily for antimicrobial susceptibility testing.

Contact Plate: 10 x 60 mm plated media used for surface sampling for microbial contamination. The plate contains agar which is above the edge of the plate so it can be inverted and the agar placed on a surface. The plate also contains a grid on the bottom surface to aid in counting colonies of microorganisms growing on agar surface after incubation. Selected contact plates feature the Thermo Scientific™ GripFit™ lid technology engineered to ensure the lid remains in place during handling and yet can be easily removed during environmental monitoring.

Isolator Wrap Sterile Contact Plates

Isolator Wrap Plates

are for surface sampling in isolator environments. These products are manufactured in a cleanroom environment and validated sterile by gamma radiation. Contact plates listed are made using GripFit technology, which ensures the lid remains in place during handling. Plates are shrink-wrapped and contained in a protective outer barrier wrap, which is impermeable to isolator decontamination procedures but maintains the integrity of the medium inside. An extra sterile bag is provided for transporting the plates to the laboratory for testing.

BactiDisk and Culti-Loop

BactiDisk, Culti-Loop, and MycoDisk products are lyophilized mixtures of charcoal, gelatin and microorganisms in a stable disk format. The disk is dissolved in 0.1 mL of appropriate culture broth, inoculated onto an appropriate culture medium and incubated at the appropriate temperature, atmosphere and time. BactiDisk products are recommended for use in performance testing of media, stains, reagents and identification kits, and for the evaluation of bacteriological procedures. Packaged 10 disks per vial.

Culti-Loop and Mycobacti-Loop products are ready to use, disposable inoculating loops containing stabilized, preserved, viable microorganisms. Each loop may be dissolved in rehydration fluid or streaked directly onto an appropriate medium. Culti-Loop products are recommended for use in performance testing of media, stains, reagents and identification kits, and for the evaluation of bacteriological procedures. Each Culti-Loop is individually sealed in a foil pouch and packaged 5 loops per package. Mycobacti-Loop products are individually sealed in a foil pouch and packaged 1 loop per package. All Culti-Loop products are **CE marked**.

MicroSEQ/RapidFinder Detection Kits

The MicroSEQ product range of assays are based on TaqMan™ real-time PCR. Real-time PCR is a proven method for pathogen detection and has been applied successfully to a wide range of foodborne pathogens. The method tests for food pathogens by amplifying and detecting a DNA target sequence that is specific to the organism under investigation. In this way, real-time PCR can detect pathogens quickly, simply, and with outstanding sensitivity and specificity. Since the MicroSEQ assays uses fast PCR chemistry, the PCR run time takes only 40 minutes, compared with up to 3 hours using standard PCR. The MicroSEQ range and RapidFinder STEC solutions have been validated by AOAC RI PTM, AFNOR, and DAFF.

TaqMan™ Pathogen Detection Kits

TaqMan™ Pathogen Detection Kits are part of a systems approach that helps user to detect food pathogens both rapidly and accurately. The kits use molecular methods (i.e., Real-Time PCR) to simplify handling and to reduce the time-to-result. The kits have undergone rigorous internal testing. All TaqMan™ Pathogen Detection Kits use a uniform protocol to facilitate simplified workflows and generate consistent results. Both the PCR reaction and the PCR run protocol are standardized so that multiple pathogens can be screened on the same plate in the same PCR run.
