**WARNING!** Read the Safety Data Sheets (SDSs) and follow the handling instructions. Wear appropriate protective eyewear, clothing, and gloves. Safety Data Sheets (SDSs) are available from www.lifetechnologies.com/support.

**Product description**

T7 RNA Polymerase-Plus™ Enzyme Mix contains T7 RNA polymerase and RNase inhibitor for broad-spectrum protection against enzymatic degradation of the synthesized RNA.

**Source:** An *E. coli* strain harboring a plasmid that overexpresses T7 RNA Polymerase.

**Unit (U) definition:** One unit is the amount of T7 RNA Polymerase-Plus™ Enzyme Mix required to catalyze the incorporation of 1 nmol of nucleoside triphosphate into acid-insoluble material in 60 minutes at 37°C.

**Storage buffer (not included):** 20 mM KPO₄ pH 7.7, 100 mM NaCl, 1 mM EDTA, 10 mM DTT, 50% glycerol (v/v), and detergent.

**Using T7 RNA Polymerase-Plus™ Enzyme Mix**

T7 RNA Polymerase-Plus™ Enzyme Mix is ideal for the synthesis of RNA for blot and in situ hybridization probes, RPA analysis, in vitro translation, and antisense RNA. T7 RNA polymerase is highly specific for its own promoter, a conserved 23 bp sequence that is not efficiently recognized by SP6 or T3 RNA polymerases. It will transcribe large amounts of RNA from DNA sequences (for example, plasmids, polymerase chain reaction (PCR) fragments, or hybridized oligonucleotides) downstream of its promoter, without cross-talk from nearby SP6 or T3 promoters. Thus, RNA molecules transcribed from a linear template will be of a defined length.

Using circular plasmid DNA as a template will result in heterogeneous transcripts of multiple lengths.

**Labeled transcription reactions**

The yield and amount of full-length RNA transcript obtained depend on the ratio of template DNA to the concentration of the limiting ribonucleoside triphosphate (rNTP) in the transcription reaction. Typically, three nucleotides are present at 500 µM and the nucleotide used for labeling is at various concentrations, depending on the desired specific activity of the probe (Tabor and Richardson, 1985). The limiting nucleotide should generally be present at a minimum of 3 µM to maximize synthesis of full-length RNA transcripts. Under standard assay conditions, >50% of the label is incorporated in 30 minutes into RNA.

We find that temperature is not a critical variable, although 37°C is frequently recommended as the appropriate incubation temperature. In fact, lower temperatures seem to favor the synthesis of full-length transcripts under conditions of limiting nucleotide concentration. It may be convenient to run these reactions at room temperature.

The following reaction conditions will yield labeled RNA probe suitable for use with Northern blots containing a moderately abundant mRNA.

**Typical labeled transcription reaction conditions (20-µL reactions):**

- 1 µg template DNA
- 2 µL 10X Transcription Buffer (included)
- 500 µM (final) rNTPs (A, G, C)
- 50 µCi [α-³²P]UTP (800 mCi/mmol, 10 mCi/mL)
- 20 U T7 RNA Polymerase-Plus™ Enzyme Mix
- Nuclease-free water to a final volume of 20 µL

Incubate 30 minutes at 37°C.
Treat the reaction with DNase I to remove DNA template (optional; see below) or simply stop the transcription reaction by adding 2 μL of 0.2 M EDTA and/or heating to 65°C.

Unlabeled transcription reactions

In this reaction, rNTP levels are not limiting, and large amounts of RNA are synthesized throughout the incubation period. Frequently, more than 4 μg RNA may be synthesized per μg of input DNA.

Note: This protocol may be altered to include nonisotopically-labeled rNTPs. See Technical Bulletin 173, Methods for Nonisotopic Labeling for a protocol and sources of these nucleotides.

Typical unlabeled transcription reaction conditions (20-μL reaction):

- 1 μg template DNA
- 2 μL 10X Transcription Buffer (included)
- 500 μM (final) rNTPs (A, C, G, U)
- 20 U T7 RNA Polymerase-Plus™ Enzyme Mix
- Nuclease-free water to a final volume of 20 μL

Incubate 60 minutes at 37°C.
