</table>
| Proteinase K (Component A)                                              | 10 mL  | 1X solution   | • 2–8°C  
• Desiccate  
• Protect from light  
• DO NOT FREEZE                                                  |
| Click-iT™ TUNEL Colorimetric Reaction Buffer (Component B)              | 4 mL   | 10X TBS       |                                                                          |
| Copper II sulfate [CuSO₄] (Component C)                                 | 1 mL   | 100 mM aqueous solution |                                                                          |
| Click-iT™ TUNEL Colorimetric Reaction Buffer Additive (Component D)     | 400 mg | N/A           |                                                                          |
| Click-iT™ TUNEL Colorimetric Wash Buffer (Component E)                  | 60 mL  | 100X solution |                                                                          |
| Streptavidin-Peroxidase Conjugate (Component F)                        | 10 mL  | 1X solution   |                                                                          |
| DAB Substrate Buffer (Component G)                                     | 20 mL  | 1X solution   |                                                                          |
| DAB Chromogen (Component H)                                            | 1 mL   | 40X reagent   |                                                                          |
| UltraPure™ SSC (Component I)                                           | 50 mL  | 20X           |                                                                          |
| TdT Reaction Buffer (Component J)                                      | 8 mL   | 1X solution   |                                                                          |
| EdUTP nucleotide mixture (Component K)                                 | 55 μL  | 50X solution  |                                                                          |
| TdT (terminal deoxynucleotidyl transferase), recombinant [Component L]² | 4 vials (34 μL per vial) | 15 U/μL in glycerol         | • ≤−20°C  
• Protect from light                                             |
| Biotin azide (Component M)                                             | 50 μg  | N/A           |                                                                          |
| Dimethylsulfoxide (DMSO) [Component N]                                 | 200 μL | N/A           |                                                                          |
| Wash chamber³                                                           | 1 unit | N/A           | Room temperature                                                         |

¹ These storage conditions are appropriate when storing the entire kit upon receipt. For optimal storage conditions, see the labels of individual components.  
² IMPORTANT! Component L is VERY temperature sensitive. Keep it at −20°C until ready to use.  
³ The Wash chamber has been included in the kit for your convenience. We recommend using it for Steps 5.11 and 6.6.

**Number of assays:** Sufficient material is supplied for 50 coverslips based on the protocol below.  
**N/A:** Not applicable.

For Research Use Only. Not for use in diagnostic procedures.
Introduction

Understanding the mechanisms of programmed cell death or apoptosis can represent a critical aspect of toxicological profiling and drug discovery. Based on the cellular changes during programmed cell death, apoptosis is often classified into early, middle, and later stages. The later stages of apoptosis are characterized by changes in nuclear morphology, chromatin condensation, nuclear envelope degradation, and DNA fragmentation.

Since the introduction of terminal deoxynucleotidyl transferase-dUTP nick end labeling (TUNEL) assay in 1992, the TUNEL assay has become the most widely used in situ test for the study of apoptosis. The TUNEL assay is based on the incorporation of modified dUTPs by the enzyme terminal deoxynucleotidyl transferase (TdT) at the 3'-OH ends of fragmented DNA, a hallmark as well as the ultimate determinant of apoptosis. The modifications are fluorophores or haptens, including biotin, which can be detected directly in the case of a fluorescently-modified nucleotide (i.e., fluorescein-dUTP) or indirectly with HRP (horse radish peroxidase) conjugated to streptavidin or antibodies.

System overview

The Click-iT™ TUNEL Colorimetric assays utilize an EdUTP (a dUTP modified with a small, bioorthogonal alkyne moiety) nucleotide, which is incorporated at the 3'-OH ends of fragmented DNA by the TdT enzyme. After the incorporation of the modified nucleotide at the site of DNA fragmentation, biotin-azide is added to the sample. After a brief click reaction, a copper catalyzed covalent reaction between the azide and alkyne moiety, the biotin is attached to the modified nucleotide. Next, Streptavidin-Peroxidase (horseradish peroxidase) is added to the sample and attaches to the biotin group. Finally, addition of the DAB (peroxidase) substrate results in the colorimetric detection of apoptotic cells (Figure 1).

Figure 1. Detection of apoptosis with the Click-iT™ TUNEL Colorimetric assay.
Because of the high degree of labeling specificity inherent in the click technology and the small size of the alkyne moiety, the EdUTP nucleotide is more readily incorporated by TdT than other modified nucleotides (Figure 2). The benefits of labeling specificity and increased incorporation efficiency are low background and improved detection of apoptotic cells as demonstrated in Figure 3.

The Click-iT™ TUNEL Colorimetric assay has been optimized and contains all of the components needed to label and detect apoptotic cells from FFPE (formalin-fixed, paraffin embedded) tissue samples. The kits include sufficient reagents for labeling fifty (50) 18 × 18-mm coverslips using 50 μL of reaction reagent per test. The kits are flexible and can be configured for 50 independent TUNEL apoptosis tests.

**Figure 2.** Comparison of TdT incorporation of several modified nucleotides. A 48-bp oligonucleotide was incubated with 30 units of TdT and an equimolar mix of the modified nucleotide with three other nucleotides for 4 hours at room temperature. The TdT reaction products were then analyzed by gel electrophoresis using a 20% TBE pre-cast gel and subsequent staining with SYBR™ Gold nucleic acid gel stain.

**Figure 3.** Click-iT™ TUNEL Colorimetric assay was used to detect apoptotic cells (nuclei, brown) in a sample of formalin-fixed paraffin embedded (FFPE) mouse intestines that were counter stained with methyl green (nuclei, green).
Before you begin

Materials required but not provided
- Xylene
- 100% Ethanol
- 0.85% NaCl solution
- 1X Phosphate buffered saline (PBS) (Cat. No. 14190-144 or 14190-250)
- 4% paraformaldehyde in PBS (fixative reagent)
- 1X Tris buffered saline (TBS) (Cat. No. 28358)
- 3% H₂O₂ in PBS
- Molecular biology grade, deionized water (DNase/RNase free)
- 22 × 22-mm or 18 × 18-mm coverslips (for standard microscopy)
- DNase I (Cat. No. 18068-015)

IMPORTANT! Do not use azide. Sodium azide negatively affects the click reaction.

Storage and handling
Upon receipt, store the kit components as described until required for use. For optimal storage conditions for each component, see labels on individual components.

IMPORTANT! TdT (terminal deoxynucleotidyl transferase) (Component L) is VERY temperature sensitive. Keep it at –20°C until ready to use.

Cautions
DMSO is hazardous; avoid contact with skin and eyes and do not swallow. Handle reagents containing DMSO using equipment and practices appropriate for the hazards posed by such materials.

TdT Reaction Buffer (Component J) contains potassium cacodylate and cobalt chloride, and it is harmful if swallowed. In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. If swallowed, seek medical advice immediately. Wear appropriate laboratory protective clothing, gloves, and eye/face protection when handling this reagent.

Prepare solutions

Allow vials to warm to room temperature before opening.

1.1 1X Click-iT™ TUNEL Colorimetric Reaction Buffer (Component B) working solution:
Transfer all of the solution (4 mL) in the Component B vial to 36 mL of deionized water. Rinse the Component B vial with some of the diluted Click-iT™ TUNEL Colorimetric Reaction Buffer to ensure the transfer of all of the 10X concentrate.

To make smaller amounts of 1X Click-iT™ TUNEL Colorimetric Reaction Buffer, dilute volumes from the Component B bottle 1:10 with deionized water. After use, store any remaining 1X solution at 2–8°C. When stored as directed, this 1X solution is stable for up to 6 months.
1.2 10X Click-iT™ TUNEL Reaction Buffer Additive (Component D) stock solution: Add 2 mL of deionized water to the Component D vial, then mix until fully dissolved. After use, aliquot the 10X Click-iT™ TUNEL Buffer Additive stock solution and store remaining stock solution at ≤–20°C. When stored as directed, this stock solution is stable for up to 1 year. If the solution develops a brown color, it has degraded and should be discarded.

1.3 Biotin azide (Component M) stock solution: Add 32 μL of DMSO (Component N) to the Component M vial and mix well. Aliquot the stock solution and store at ≤–20°C.

1.4 2X SSC solution: Dilute Component I 1:10 into deionized water.

1.5 1X Click-iT™ TUNEL Colorimetric Wash solution: Dilute the Click-iT™ TUNEL Colorimetric Wash Buffer (Component E) 1:100 into 1X TBS.

Experimental protocol for tissue sections

The following protocols describe how to perform the Click-iT™ TUNEL Colorimetric imaging assay on FFPE tissue samples.

Deparaffinize tissue sections

2.1 To deparaffinize tissue sections, place the slides in a rack and perform the following washes in a Coplin staining jar:

Note: Perform all deparaffinization steps at room temperature.

Fix and permeabilize tissues

3.1 Immerse the slides in fixative solution (4% paraformaldehyde) for 15 minutes at room temperature.

3.2 Wash the slides by immersing them in PBS for 5 minutes.

3.3 Add sufficient volume of Proteinase K (Component A) to completely cover the tissue sections.

   **Note:** Use less than 200 μL of Proteinase K per tissue section. Otherwise, you will run out of Proteinase K.

3.4 Incubate the samples for 10–20 minutes at room temperature.

   **Note:** We recommend using a cover slip or a humidified chamber to protect against evaporation.

   **Note:** Depending on the tissue type, thickness, and degree of fixation, it may be necessary to optimize the Proteinase K incubation time.

3.5 Wash the slides by immersing them in PBS for 5 minutes.

3.6 Immerse the slides in fixative solution (4% paraformaldehyde) for 5 minutes at room temperature.

3.7 Rinse slides with PBS.

3.8 Wash the slides twice by immersing them in PBS for 5 minutes each.

3.9 Rinse the slides with deionized water.

Optional: Positive control

4.1 To induce DNA strand breaks (i.e., TUNEL positive cells), incubate fixed and permeabilized cells with 1 U of DNase I (Cat. No. 18068015) diluted into 1X DNase I Reaction Buffer (20 mM Tris-HCl, pH 8.4, 2 mM MgCl$_2$, 50 mM KCl) for 30 minutes at room temperature.

4.2 After incubation, wash once with deionized water and proceed to TdT reaction (below).

TdT reaction

5.1 Add 100 μL of TdT Reaction Buffer (Component J) to each slide and allow the solution to spread completely over the tissue.

   **Note:** We recommend using a cover slip or a humidified chamber to protect against evaporation.

5.2 Incubate the slides for 10 minutes at 37°C.
5.3 Prepare the TdT reaction mixture as shown in Table 3, below.

**IMPORTANT!** TdT enzyme (Component L) is highly temperature sensitive. Keep the enzyme in the –20°C freezer until ready to use. Gently pipette the reaction mixture to incorporate the TdT enzyme. Stirring by vortex is not recommended.

</tr>
</tbody>
</table>

5.4 Remove the TdT reaction buffer from the samples by gently blotting with a paper towel. Make sure that the tissue sample does not dry.

5.5 Add 50 μL of the prepared TdT reaction mixture (from Step 5.3) to each slide and incubate for 60 minutes at 37°C.

**Note:** We recommend using a cover slip or a humidified chamber to protect against evaporation.

5.6 Rinse the slides with PBS.

5.7 Immerse the slides in 2X SSC (from Step 1.4) for 15 minutes to fully quench the TdT reaction.

5.8 Wash the slides twice by immersing them in PBS for 5 minutes each.

5.9 To quench endogenous peroxidase enzymes, immerse the slides into a solution of 3% H₂O₂ for 5 minutes at room temperature.

5.10 Wash the slides twice by immersing them in PBS for 5 minutes each.

5.11 Wash the slides twice with 1X Click-iT™ TUNEL Colorimetric Wash solution (from Step 1.5) for 5 minutes each.

**Note:** For this step, we recommend using the Wash chamber included in the kit.
6.1 Prepare 1X Click-iT™ TUNEL Reaction Buffer Additive working solution by diluting the 10X solution (from Step 1.2) 1:10 in deionized water. Prepare this solution fresh and use it on the same day. Discard any unused 1X solution.

6.2 Prepare the Click-iT™ TUNEL Colorimetric Reaction cocktail according to Table 4. It is important that you add the reaction components in the order listed; otherwise, the reaction will not proceed optimally.

**Note:** Use the Click-iT™ Plus TUNEL Reaction cocktail within 15 minutes of preparation.

<table>

</tbody>
</table>

* Add the reaction components in the order listed.

6.3 Immediately after preparation, add 50 μL of the Click-iT™ TUNEL Colorimetric Reaction cocktail (from Step 6.2) to each slide and allow the solution to spread completely over the surface of the tissue section.

6.4 Incubate for 30 minutes at 37°C, protected from light.

**Note:** We recommend using a cover slip or a humidified chamber to protect against evaporation.

6.5 Rinse the slides with 1X PBS.

6.6 Wash each slide 2 times with the 1X Click-iT™ TUNEL Colorimetric Wash solution (from Step 1.5) for 5 minutes each.

**Note:** For this step, we recommend using the Wash chamber included in the kit.

6.7 Rinse the slides with deionized water.

6.8 Add a sufficient amount of the 1X Streptavidin-Peroxidase Conjugate (Component F) to cover the tissue (~200 μL) and incubate at room temperature for 30 minutes in a humidified chamber.

**Note:** Covering the tissue with a coverslip during incubation steps will allow the tissue to be covered uniformly by the reaction components. Dry the slide edges prior to adding the Streptavidin-Peroxidase Conjugate to prevent wicking.

6.9 Remove unbound Streptavidin-Peroxidase Conjugate by washing the slides 3 times for 5 minutes with 1X PBS each at room temperature. If using a coverslip, tip the slide to remove the coverslip before proceeding with the wash step.

6.10 Rinse briefly in deionized water, and remove residual water without allowing the tissue to dry out.
6.11 For each slide to be developed, prepare 100 μL of 1X DAB reaction mixture by combining 5 μL of DAB Chromogen (Component H) with 95 μL of DAB Substrate Buffer (Component G) in a centrifuge tube immediately before use. This results in a 1:20 dilution of the DAB Chromogen in DAB Substrate Buffer.

**IMPORTANT!** Prepare the 1X DAB reaction mixture immediately before use. Discard any unused 1X solution.

**Note:** Depending on the desired signal strength, you may need to optimize the 1:20 recommended DAB Chromogen dilution. Dilutions of 1:100 to 1:200 for the DAB Chromogen may be needed, if the signal develops too rapidly.

6.12 Add 100 μL of the 1X DAB Reaction Mixture (from Step 6.11) to each tissue section and incubate at room temperature for 1–10 minutes depending on desired signal intensity.

6.13 Wash each tissue section thoroughly with deionized water and image.

Purchaser notification

These high-quality reagents and materials must be used by, or directly under the supervision of, a technically qualified individual experienced in handling potentially hazardous chemicals. Read the Safety Data Sheet provided for each product; other regulatory considerations may apply.

Obtaining support
For the latest services and support information for all locations, go to thermofisher.com/support.

At the website, you can:
• Access worldwide telephone and fax numbers to contact Technical Support and Sales facilities
• Search through frequently asked questions (FAQs)
• Submit a question directly to Technical Support [thermofisher.com/support]
• Search for user documents, SDSs, vector maps and sequences, application notes, formulations, handbooks, certificates of analysis, citations, and other product support documents
• Obtain information about customer training
• Download software updates and patches

SDS
Safety Data Sheets (SDSs) are available at thermofisher.com/support.

Certificate of Analysis
The Certificate of Analysis provides detailed quality control and product qualification information for each product. Certificates of Analysis are available on our website. Go to thermofisher.com/support and search for the Certificate of Analysis by product lot number, which is printed on the product packaging (tube, pouch, or box).

Limited Product Warranty
Life Technologies Corporation and/or its affiliate(s) warrant their products as set forth in the Life Technologies' General Terms and Conditions of Sale found on Life Technologies’ website at www.thermofisher.com/us/en/home/global/terms-and-conditions.html. If you have any questions, please contact Life Technologies at thermofisher.com/support.
