PMT ELISA

4. REAGENTS PROVIDED

Each kit contains sufficient materials for 96/960 determinations or 48/480 bacterial extracts assayed in duplicate. The shelf life of the kit is as indicated on the outer box label.

4.1. PMT ELISA CONTENTS

Instructions For Use.

Microtitration Plate
1/10 clear plastic 96 well Microtitration Plate of 12, 8 microwell strips coated with monoclonal antibody to PMT. A resealable plastic pouch is provided for storage of unused microwells.

White Strips
1/10 white plastic microplate of 12, 8 well strips uncoated. The white wells are used for preparing extracts of bacterial specimens harvested from agar plates.

Sealing Tape
2/20 sheets of sealing tape.

One bottle of each of the following unless indicated otherwise:

Positive Control Antigen
1 x 1mL/2 x 1mL Affinity isolated, native, lyophilised PMT. Contains carrier protein.

Reconstitution Buffer
1 x 1mL/2 x 1mL buffered saline solution containing antimicrobial agent and detergent for reconstitution of Positive Control Antigen.

Conjugate
1 x 7mL/10 x 7mL of Peroxidase conjugated Fab fragment of rabbit polyclonal antibody to PMT in a buffer containing protein, coloured dye and an antimicrobial agent.

Wash Buffer Concentrate
1 x 50mL/10 x 50mL Wash Buffer concentrate (x25): Tris buffered agent and detergent for reconstitution of Wash Buffer.

Substrate
1 x 12mL/10 x 12mL Substrate stabilised peroxide and 3.3’,5,5’-tetramethylbenzidine in a dilute buffer solution. TMB has been reported to be non-carcinogenic. However, personal protective equipment is recommended to avoid direct exposure.

Stop Solution
1 x 25mL/5 x 25mL Stop Solution 0.46mol/L sulphuric acid

4.2. PREPARATION, STORAGE AND RE-USE OF KIT COMPONENTS

The PMT ELISA format allows for testing of up to 6 batches of 96-well strips. The shelf life of the kit is as indicated on the outer box label.

4.2.1 Monoclonal Antibody Coated Microwells

Open the plate pouch by cutting along the seal. Place unused microwells in the resealable plastic bag with the desiccant,for storage of unused microwells.

4.2.2 Positive Control Antigen

Add 800µL of Reconstitution Buffer to the lyophilized Positive Control Antigen. Mix the contents by gentle swirling. The Positive Control Antigen should be reconstituted at least 30 minutes prior to use. Reconstituted Positive Control Antigen should be stored at 2-8°C and used within three months. The Positive Control Antigen will be sufficient for at least 6 duplicate tests.

4.2.3 Conjugate

Ready to use. Store unused Conjugate at 2-8°C.

4.2.4 Wash Buffer Concentrate

Provided x25 concentrated. Dilute Wash Buffer by adding 1 part of Wash Buffer concentrate to 24 parts of fresh deionised or distilled water. There is sufficient concentrate to prepare 100mL working strength Wash Buffer for 4 washes of each microwell strip.

4.2.5 Substrate

Ready to use. Store unused Substrate at 2-8°C.

4.2.6 Stop Solution

Ready to use. Store unused Stop Solution at 2-8°C.

5. ADDITIONAL REAGENTS

5.1. REAGENTS

Fresh deionised or distilled water for dilution of concentrated reagents in clean containers to prevent microbial contamination.

Microwells can not be re-used.

Do not store unused working strength Wash Buffer for subsequent use (See Section 7.2.7).

5.2. ACCESSORIES

The following products are intended for use in conjunction with PMT ELISA. Contact your local distributor for further information.

Accessory Reagents for PMT serology (Code No. K003811-9)

6. EQUIPMENT

The following equipment is required:

- 96 well microtitre plates
- 1/10 clear plastic 96 well Microtitration Plate
- 1/10 white plastic microplate of 12, 8 well strips uncoated.
- 2/20 sheets of sealing tape
- 1 x 1mL/2 x 1mL Affinity isolated, native, lyophilised PMT. Contains carrier protein.
- 1 x 1mL/2 x 1mL buffered saline solution containing antimicrobial agent and detergent for reconstitution of Positive Control Antigen.
- 1 x 7mL/10 x 7mL of Peroxidase conjugated Fab fragment of rabbit polyclonal antibody to PMT in a buffer containing protein, coloured dye and an antimicrobial agent.
- 1 x 50mL/10 x 50mL Wash Buffer concentrate (x25): Tris buffered agent and detergent for reconstitution of Wash Buffer.
- 1 x 12mL/10 x 12mL Substrate stabilised peroxide and 3.3’,5,5’-tetramethylbenzidine in a dilute buffer solution. TMB has been reported to be non-carcinogenic. However, personal protective equipment is recommended to avoid direct exposure.
- 1 x 25mL/5 x 25mL Stop Solution 0.46mol/L sulphuric acid
- Mixed the contents by gentle swirling. The Positive Control Antigen should be reconstituted at least 30 minutes prior to use. Reconstituted Positive Control Antigen should be stored at 2-8°C and used within three months. The Positive Control Antigen will be sufficient for at least 6 duplicate tests.
- Ready to use. Store unused Conjugate at 2-8°C.
- Provided x25 concentrated. Dilute Wash Buffer by adding 1 part of Wash Buffer concentrate to 24 parts of fresh deionised or distilled water. There is sufficient concentrate to prepare 100mL working strength Wash Buffer for 4 washes of each microwell strip.
- Ready to use. Store unused Substrate at 2-8°C.
- Ready to use. Store unused Stop Solution at 2-8°C.

7. PRECAUTIONS

Anyone performing an assay with this product must be trained in its use and must be experienced in laboratory procedures.

7.1. SAFETY PRECAUTIONS

7.1.1 The Positive Control Antigen contains purified native PMT and should be handled and disposed of as a biohazard.

7.1.2 The Stop Solution contains sulphuric acid (0.46mol/L). Avoid eye and skin contact by wearing protective clothing and eye protection.

7.1.3 Do not eat, drink, smoke, store or prepare foods, or apply cosmetics within the designated work area.

7.1.4 Do not pipette materials by mouth.

7.1.5 Wear disposable gloves while handling clinical specimens and always wash hands after working with potentially infectious materials.

7.1.6 Dispose of all clinical specimens and reagents in accordance with local legislation.

7.1.7 Safety data sheet available for professional user on request.

7.2. TECHNICAL PRECAUTIONS

7.2.1 Components must not be used after the expiry date printed on the bottle. The conjugate and substrate may be mix or interchange different batches/lots of reagents.

7.2.2 The reagents are provided at fixed working concentrations. Test performance will be adversely affected if reagents are modified or stored under conditions other than those detailed in Section 4.2.

7.2.3 Avoid contamination of reagents.

7.2.4 Use separate disposable pipettes or pipette tips for each specimen or control in order to avoid cross contamination of either specimens, controls or reagents which could cause erroneous results.

7.2.5 Store deionised or distilled water for dilution of concentrated reagents in clean containers to prevent microbial contamination.

7.2.6 Microwells can not be re-used.

7.2.7 Do not store unused working strength Wash Buffer for subsequent use. When not in use Wash Buffer reservoirs should be rinsed with deionised or distilled water and kept at 2-8°C.

7.2.8 Manual or automated washing equipment must be free of microbial contamination, be correctly calibrated and maintained according to the manufacturer’s instructions.

7.2.9 Do not use Substrate showing a blue colour prior to its addition to the microwells.

7.2.10 Protect Substrate from light.

8. COLLECTION AND PREPARATION OF SPECIMENS

Suitable porcine microflora can be obtained from several sources, including nasal swabs, nasal washings, tonsillar swabs or from lung or tonsil tissues. Nasal swabs should preferably be obtained from the posterior part of the nasal cavity in pigs by the use of commercially available swabs, such as cotton or alginate swabs. The swabs should immediately be transferred to a transport medium eg saline. The transport time to the laboratory should be minimised as much as practically possible, and the swabs should preferably be kept at low temperatures (approx 4°C) during transport.

Primary cultures of nasal swabs are prepared in Petri dishes (diameter 9cm) on selective blood agar medium containing neomycin sulphate 2µg/mL and bacitracin 3.5µg/mL. In order to obtain an agar surface covered with numerous colonies, a few drops (50-100µL) of the transport medium should be distributed over the entire agar surface or by streaking the swab over the entire agar surface.

All colonies on the agar plate should be harvested after overnight incubation at 37°C. Add 2ml of deionised or distilled water to each plate and collect bacterial specimens using a Drigalski (“triangular”/“hockey stick”) spatula and a pipette. A smaller volume of water should not be used for the specimen preparation,
since this could cause antigen overloading.

9. TEST PROCEDURE

PLEASE REFER TO SECTION 7.2 TECHNICAL PRECAUTIONS BEFORE PERFORMING TEST PROCEDURE.

NOTE: Sample extraction must be carried out on the day prior to running the assay.

9.1. SAMPLE EXTRACTION

Locate the number of clear monoclonal antibody coated microwells into the microwell holder. Add 50µL of Conjugate to each microwell.

9.2. ASSAY PROCEDURE

NOTE: This procedure must not be followed for use with K003811-9 reagents.

NOTE: The assay procedure requires the use of a microtitration plate shaker. For information on suitability of shakers contact your local Oxoid subsidiary or distributor.

9.2.1 Conjugate Addition

Locate the required number of clear monoclonal antibody coated microwells into the microwell holder. Add 50µL of Conjugate to each microwell.

9.2.2 Specimen and Control Addition

Add 50µL of deionised or distilled water to each of the two negative control microwells (microwells B1 and B2).

9.2.3 Manual Washing

Cover microwells with a plate lid or sealing tape, and incubate overnight at 37°C for extraction to take place.

9.2.4 Automated Washing

Automated washers should be programmed to complete 4 wash cycles to and incorporate the equivalent of 2 minutes soaking time during the complete washing cycle. Washers must be correctly calibrated to ensure complete filling and emptying of microwells between each wash. After the final wash, the plate should be inverted and tapped on absorbent paper to remove the last traces of Wash Buffer.

9.2.5 Substrate Addition

Add 100µL of Substrate to each microwell.

9.2.6 Second Incubation

Incubate the microwells at plate shaker at room temperature (20-30°C) without shaking for 10 minutes, ± 2 minutes.

9.2.7 Stopping the Reaction

Add 100µL of Stop Solution to each microwell. Ensure thorough mixing in the microwells. The coloured product is stable for 30 minutes. Do not expose to direct sunlight as photobleaching of the coloured product may occur.

9.3. READING THE TEST RESULTS

The microwells should be read photometrically within 30 minutes after addition of the Stop Solution. Mix the contents of the microwells and read the absorbance of each microwell using a suitable spectrophotometer or EIA plate reader set at 450nm. Ensure that the bottoms of the microwells are clean before reading and check that no foreign matter is present in the microwells. The reader should be blanked on air (ie with no plate in the carriage) before the plate is scanned. Alternatively, if the spectrophotometer or EIA plate reader allows for the use of a reference wavelength (at 620-650nm), dual wavelength reading should be performed which will eliminate any potential interference caused by aberrations, such as dirt or marks, on the optical surface of the microwells.

9.4. SUMMARY OF PMT ELISA ASSAY PROCEDURE

Ensure all microwells are at room temperature (20-30°C) before use,

Add 50µL of Positive Control Antigen/Negative Control Specimen to appropriate wells

Incubate 60 minutes with shaking at 20-30°C

Wash (x4)

Add 100µL of Substrate

Incubate 10 minutes without shaking at 20-30°C

Add 100µL of Stop Solution

Read absorbance at 490nm

10. QUALITY CONTROL AND INTERPRETATION OF TEST RESULTS

10.1. NEGATIVE CONTROL

As detailed in Section 9.2.2 (Specimen and Control Addition), two Negative Control microwells must be included in each assay.

Calculate the mean OD value for two Negative Control wells – ODNegative Control

ODNegative Control must be less than 0.150 absorbance units but greater than 0.000 absorbance units.

If ODNegative Control is <0.000 absorbance units then the reader should be reblanked on air and the wells re-read.

If ODNegative Control Quality control requirements are not met, test results may be invalid and the assay procedure should be repeated.

10.2. POSITIVE CONTROL

As detailed in Section 9.2.2 (Specimen and Control Addition), at least 2 Positive Control microwells must be included in each assay.

Calculate the mean OD value for the two Positive Control microwells – ODPositive Control

ODPositive Control must be greater than 0.500 absorbance units. If ODPositive Control is less than 0.500 absorbance units test results may be invalid and the assay procedure should be repeated.

10.3. SPECIMENS

Bacterial extracts should be considered as positive for the presence of PMT if both of the following criteria are met:

Mean specimen OD is ≥ ODNegative Control plus 0.100 absorbance units.

And

Mean specimen OD is ≥ 5 x ODNegative Control

If only one of the above criteria is fulfilled, a retest of the remaining extract should be performed, or a repeat specimen requested.

11. PERFORMANCE LIMITATIONS

11.1. Contamination of the chromogenic Substrate may cause falsely high OD values and may cause quality control criteria to fail.

11.2. Washing the microwells too vigorously or incubating at a low temperature may cause falsely low OD values and may cause quality control criteria to fail.

11.3. The PMT ELISA may also be used for the differentiation of toxigenic and non-toxigenic P. multocida in pure cultures. When testing pure cultures the extraction step used with primary mixed cultures can be omitted and the specimen can be tested immediately after being harvested from the agar plate.

11.4. The PMT ELISA may also be used in conjunction with PMT accessory reagents (Code No. K003811-9) for the detection of antibodies to PMT in serum or colostrum from animals suspected of having toxigenic P. multocida infection, or from animals that have been vaccinated with vaccines containing PMT or PMT analogues. For further details contact your local distributor.
