Dynabeads® Mouse T-Activator CD3/CD28

For activation of mouse T cells
Catalog nos. 11452D, 11453D, 11456D

Store at 2˚C to 8˚C

For research use only
see “Related Products”.

For expansion of antigen-specific T cells, polyclonal T cells, T cell proliferation or expansion to differentiate into T helper cell subsets, receptor signaling, proteomics, or gene infection/transduction or to study T cell shortly after activation (for transfection/transduction).
The activated T cells can be analyzed similar in size to the antigen-presenting cells CD28, bound to a three-dimensional bead similar in size to the antigen-presenting cells (below).

Downstream Applications
The activated T cells can be analyzed shortly after activation (for transfection/transduction or to study T cell receptor signaling, proteomics, or gene expression). T cells can be left in culture to differentiate into T helper cell subsets, T cell proliferation or expansion of polyclonal T cells.

For expansion of antigen-specific T cells, see “Related Products”.

Protocol
This product allows for easy activation of mouse T cells, without the need for preparing antigen-presenting cells (APCs) or antigen.

Prepare Cells
- See www.lifetechnologies.com/cellisolation for recommended Dynabeads® products for positive or negative isolation of all mouse T cells, or specific T cell subsets. Follow the procedure described in the respective package insert.
- Note that for isolation of Treg cells (flow sorting or magnetic bead isolation), it is critical to use an anti-CD25 antibody that does not block the binding of IL-2 if cells are used for expansion. Dynabeads® FlowComp Mouse CD4+CD25+ Treg Cells can be used.

- Prepare cell culture medium.

Wash Dynabeads® Magnetic Beads
Wash Dynabeads® magnetic beads before use.
1. Resuspend the magnetic beads in the vial (i.e. vortex for >30 sec, or tilt and rotate for 5 min).
2. Transfer the desired volume of magnetic beads to a tube.
3. Add an equal volume of Buffer, or at least 1 mL, and mix (vortex for 5 sec, or keep on a roller for at least 5 min).
4. Place the tube on a magnet for 1 min and discard the supernatant.
5. Remove the tube from the magnet and resuspend the washed magnetic beads in the same volume of culture medium as the initial volume of magnetic beads taken from the vial (step 2).

Activate Mouse T cells
1. Start with 8 x 10^6 purified T cells in 100–200 µL medium in a 96-well tissue culture plate.
2. Add 2 µL pre-washed and resuspended Dynabeads® magnetic beads to obtain a bead-to-cell ratio of 1:1 (see Table 1).
3. Incubate in a humidified CO_2 incubator at 37°C, according to your specific experimental requirements.
4. Harvest the activated T cells and use directly for further analysis.
5. For flow cytometry applications, remove the beads prior to staining. Place the tube on a magnet for 1–2 min to separate the beads from the solution. Transfer the supernatant containing the cells to a new tube.

Note: To increase recovery of T cells in the supernatant, resuspend the bead/cell suspension thoroughly by pipetting prior to magnetic separation (some cells bind strongly to the beads upon activation and for 2–3 days thereafter). To further increase cell recovery, culture the bead-bound cell fraction overnight and repeat step 5.

Expand Mouse T cells
1. Start with 1–1.5 x 10^6 purified T cells/mL in culture medium in a suitable tissue culture plate or tissue culture flask.
2. Add Dynabeads® magnetic beads at a bead-to-cell ratio of 1:1 (see Table 1).
3. Add 30 U/mL rIL-2.
4. Incubate in a humidified CO_2 incubator at 37°C, according to your specific experimental requirements.
5. Examine cultures daily, noting cell size and shape. Cell shrinking and reduced proliferation rate is typically observed in exhausted cell cultures.
6. Count the cells at least twice weekly after thorough resuspension.
7. When the cell density exceeds 2.5 x 10^6 cells/mL or when the medium turns yellow, split cultures back to a density of 0.5–1 x 10^6 cells/mL in culture medium containing 30 U/mL rIL-2.

For research use only. Not for use in diagnostic procedures.
Restimulation

Cell cultures showing signs of exhaustion (typically at day 7–10 of expansion) can be restimulated several times by adding fresh Dynabeads® magnetic beads and rIL-2. The CD8+ T cells remain cytotoxic after repeated restimulations. Restimulation is typically necessary when cell shrinking and a reduced rate of proliferation is observed.

Guidelines for restimulation are provided in Table 2. Optimize for your particular application. Do not use an excess volume of Dynabeads® magnetic beads, as this may inhibit expansion.

1. Prior to restimulation, remove the used Dynabeads® magnetic beads by transferring the cells to a suitable tube.
2. Place the tube in the magnet for 1–2 min.
3. Transfer the supernatant containing the cells to a new tube.
4. Split the cultures back to a density of 0.5–1 × 10⁶ cells/mL in culture medium containing 30 U/mL rIL-2 and repeat the “Expand Mouse T Cells” procedure.

Expand Mouse Regulatory T Cells

1. Start with 1–1.5 × 10⁶ cells/mL culture medium in a suitable tissue culture plate (see Table 1).
2. Add Dynabeads® magnetic beads at a bead-to-cell ratio of 2:1 (twice the amount recommended in Table 1).
3. Add rIL-2 at a concentration of 2000 U/mL.
4. Incubate in a humidified CO₂ incubator at 37°C for the length of your specific experiment.
5. Examine cultures daily, noting cell size and shape. Cell shrinking and reduced proliferation rate is typically observed in exhausted cell cultures.
6. Count the cells at least twice weekly after thorough resuspension.
7. Restimulate cells according to the “Restimulation” procedure when the cell density exceeds 2.5 × 10⁶ cells/mL or when the medium turns yellow.

Treg cells retain FoxP3 expression after 2 weeks expansion.

Description of Materials

Dynabeads® Mouse T-Activator CD3/CD28 are uniform 4.5 μm, superparamagnetic polymer beads coated with an optimized mixture of monoclonal antibodies against the CD3 and CD28 cell surface molecules of mouse T cells. The CD3 antibody is specific for the epsilon chain of mouse CD3, which is considered to be a subunit of the TCR complex. The CD28 antibody is specific for the mouse CD28 co-stimulatory molecule, which is the receptor for CD80 (B7-1) and CD86 (B7-2). Both antibodies are hamster anti-mouse IgGs coupled to the same bead, mimicking in vivo stimulation by APCs. Both the bead size and the covalent antibody coupling technology are critical parameters to allow the simultaneous presentation of optimal stimulatory signals to the T cells in culture, thus allowing their full activation and expansion.

Limited Use Label License No. 397: ex vivo activation or expansion of T-cells

Notice to Purchaser: The purchase of this product conveys to the buyer the non-transferable right to use of the purchased amount of the product and components of the product in research conducted by the buyer (whether the buyer is an academic or for Profit entity) other than research directed to developing, making, using, selling, and offering to sell pharmaceutical products containing CTLA4-Ig or a mutant thereof. The buyer cannot sell or otherwise transfer (a) this product, (b) its components, or (c) materials made using this product or its components to a third party or otherwise use this product or its components or materials made using this product or its components for Commercial Purposes. The buyer may not use this product for any Commercial Purpose. The buyer may transfer information or materials made through the use of this product to a scientific collaborator, provided that such transfer is not for any Commercial Purpose, and that such collaborator agrees in writing (a) not to transfer such materials to any third party, and (b) to use such transferred materials and/or information solely for research and not for Commercial Purposes. Commercial purposes means any activity by a party for consideration and may include, but is not limited to: (1) use of the product or its components in manufacturing; (2) use of the product or its components to provide a service, information, or data; (3) use of the product or its components for therapeutic, diagnostic or prophylactic purposes or in connection with any Phase III clinical trials, clinical trials or post registration clinical trials; or (4) resale of the product or its components, whether or not such product or its components are resold for use in research. For products that are subject to multiple limited use license labels, the most restrictive terms apply. If the purchaser is not willing to accept the limitations of this limited use statement, Life Technologies is willing to accept return of the product with a full refund.
